Post-Experience Diploma in Statistics For students entering in 2007

Awarding Institution: Teaching Institution: Relevant QAA subject benchmarking group: Mathematics, Statistics and Operational

Faculty of Life Sciences Date of Specification: July 2007 Programme Director: Programme Advisor: Board of Studies: Accreditation.

The University of Reading The University of Reading Research Programme length: 1 year

Dr K L Ayres Dr K L Ayres Statistics Postgraduate Board of Studies

Summary of programme aims and learning outcomes

The programme aims to provide a broad range of practical skills in statistics. This is achieved by providing modules which cover the basic principles of drawing conclusions from data, as well as those concentrating on the practical applications of the subject. The modules are complemented by tutorials specifically for the Diploma. A distinguishing feature of the programme is that it gives strong emphasis on the practical applications of statistics in a variety of areas, including business, biological sciences, economics, industry, and medicine.

For those students planning to continue to the MSc in Biometry, the modules taken are specified to ensure the necessary theoretical background for the MSc. The Diploma year then becomes the first of a two-year programme with the aim of students becoming competent in thinking and working with mathematical language, and learning the key statistical concepts.

Students are welcome to attend modules other than those specified, but even if assessed they will not count towards the final Diploma grade.

For a full statement of the programme aims and outcomes, see below.

Transferable skills

The University's Strategy for Teaching and Learning has identified a number of generic transferable skills which all students are expected to have developed by the end of their programme. In following this programme, students will have had the opportunity to enhance their skills relating to career management, communication (both written and oral), information handling, numeracy, problem-solving, team working and use of information technology.

As part of this programme students are expected to have gained experience and show competence in the following transferable skills: IT (word-processing, spreadsheet, database and statistical software), scientific writing, oral presentation, team-working, problem-solving, use of library and internet resources, time-management, and career planning.

Programme content

The profile which follows states which modules must be taken (the compulsory part), together with a list of modules from which the student must make a selection (the "selected" modules). Students must choose such additional modules as they wish, in consultation with their programme advisor, to make 120 credits in total. The number of credits for each module is shown after its title.

Diploma

		Credits	Level
Compulsory mo	dules		
AS1A	Communicating with Statistics	20	С
AS1B	Probability and Statistical Methods	20	С
AS1C	Mathematical Methods for Statistics	20	С
AS2B	Linear Models	20	Ι
AS2F	Study Design and Sampling Methods	20	Ι
Selected module	25:		
Choose one of			

AS2H	Forensic Statistics and Genetics	20	Ι
AS2D	Medical Statistics	20	Ι
*AS2A	Statistical Theory and Methods	20	Ι

* If the student intends to proceed to the MSc in Biometry, this module **must** be taken.

Requirements for a Pass and Progression requirements

Students are assessed on all modules by a mixture of examinations and continuously assessed assignments. The division of marks between examinations and assignments varies from module to module (see module descriptions). A final mark is obtained for each module. To pass, students must obtain an overall average of at least 40% over the 120 credits taken, and a mark of at least 30% in individual modules amounting to not less than 100 credits.

Distinctions will be considered for average marks of around 80% or more.

In general, students wishing to proceed to the MSc should obtain at least 65% overall. In particular, students need to show that their mathematical ability is of a high enough standard.

Summary of teaching and assessment

Teaching is organised in modules that typically involve both lectures and practicals. The assessment is carried out within the University's degree classification scheme, details of which are in the programme handbook. The pass mark in each module is 40%. Modules are normally assessed by a mixture of coursework and formal examination.

Admission requirements

Entrants to this programme are normally required to have obtained a first degree or have other qualifications enhanced by practical experience of working as a statistician.

Support for students and their learning

University support for students and their learning falls into two categories. Learning support includes IT Services, which has several hundred computers and the University Library, which across its three sites holds over a million volumes, subscribes to around 4,000 current periodicals, has a range of electronic sources of information and houses the Student Access to Independent Learning (S@IL) computer-based teaching and learning facilities. There are language laboratory facilities both for those students studying on a language degree and for those taking modules offered by the Institution-wide Language Programme. Student guidance and welfare support is provided by Personal Tutors, the Careers Advisory Service, the University's Special Needs Advisor, Study Advisors, Hall Wardens and the Students' Union.

Within the providing departments additional support is given though practical classes, and the development of problem-solving skills is assisted by provision of model solutions to exercises. Advice on statistical computing is available from the computing staff in the School. There is a Programme Director to offer advice on the choice of modules within the programme.

Career prospects:

In recent years, most students who have followed this programme have chosen to gain entry to an MSc programme in Statistics. The programme has also enabled students to enhance their career opportunities.

Educational aims of the programme

The programme aims to provide a thorough education in statistics for those students with little formal training in statistics who wish to develop their statistical skills either to help in their work, to change career, or to prepare for a Masters programme in statistics. The programme covers the basic ideas of summarising and presenting data, statistical inference and linear modelling. Strong emphasis is given to practical applications of the subject, and the use of statistical software in data analysis.

Programme outcomes

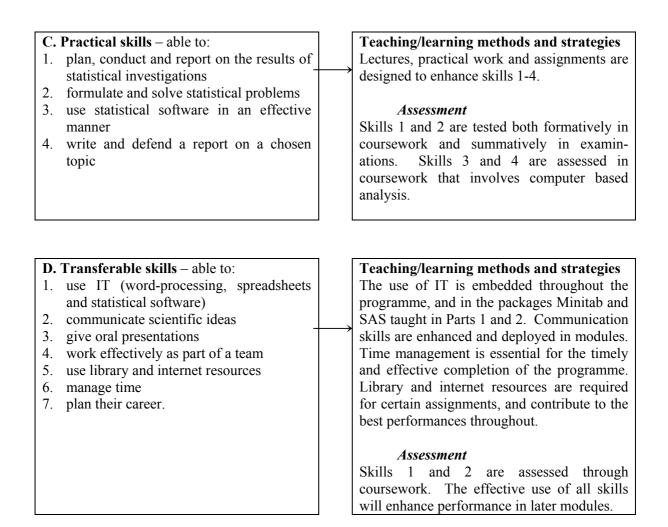

The programme provides opportunities to develop and demonstrate knowledge and understanding, skills, qualities and other attributes in the following areas:

Knowledge and Understanding

A. Knowledge and understanding of:		Teaching/learning methods and strategies		
1.	the fundamental concepts and techniques	The knowledge required for the basic topics		
	of data summary and presentation,	is delineated in formal lectures supported by		
	statistical inference and linear modelling -	\rightarrow problem sets for students to tackle on their		
2.	the application of statistics in a variety of	11 2		
	areas	practical classes through which students car		
3.	a selection of more specialist optional	*		
	topics	work.		
4.	the use of statistical software in data	In the programme students are expected to		
	analysis.	work on practical problems on their own and		
		seek help when required. Model solutions		
		are provided for problems set.		
		4		
		Assessment		
		Most knowledge is tested through a		
		combination of coursework and unseer		
		formal examinations. Dissertations and ora		
		presentations also contribute in other parts of		
		the programme.		

Skills and other attributes

B. Intellectual skills – able to:	Teaching/learning methods and strategies	
 think logically analyse and solve problems organise tasks into a structured form transfer appropriate knowledge and methods from one topic within the subject to another recognise and use appropriate statistical methods in data analysis 	Logic is an essential part of the understanding of statistical techniques, and the use of statistical software for data analysis is embedded throughout the programme. The quality of solutions to a problem is substantially determined by the structure of that response; analysis, synthesis, problem solving, integration of theory and application, and knowledge transfer from one topic to another are intrinsic to high-level performance in the programme.	
	<i>Assessment</i> Skills 1-3 are assessed indirectly in most parts of the programme, while 4 contributes to the more successful work. Skill 5 is assessed in practical work	

Please note - This specification provides a concise summary of the main features of the programme and the learning outcomes that a typical student might reasonably be expected to achieve and demonstrate if he/she takes full advantage of the learning opportunities that are provided. More detailed information on the learning outcomes, content and teaching, learning and assessment methods of each module can be found in the module description and in the programme handbook. The University reserves the right to modify this specification in unforeseen circumstances, or where the process of academic development and feedback from students, quality assurance processes or external sources, such as professional bodies, requires a change to be made. In such circumstances, a revised specification will be issued.
